An Introduction to Single Screw Extrusion

An Introduction to Single Screw Extrusion For those that don't know what extrusion is, it is a process where products are created when material is forced through a die so that it can form a shape. Thermoplastics are some of the materials that go through the extrusion process. 65% of plastics have been through the extrusion process.

An Introduction to Single Screw Extrusion - Sprocket Works

Single screw extrusion uses one screw within a cylindrical barrel to continuously push plastic through a constant profile die (Figure 12.7). Production rate is typically measured in mass per hour (lb/hour or kg/hour) and is controlled by the screw speed of the machine. Sign in to download full-size image Figure 12.7.

The barrel of a single-screw extruder usually is a long, thick-walled tube of alloy steel, into which a hard, highly crystal-line wear-resistant alloy has been centrifugally cast. Attached to the feed end of the barrel (often as a separate casting) is an opening into the barrel bore for feeding the raw material.

A schematic of a gear pump assisted extrusion process is shown in Figure 1 for a single-stage extruder. If the pressure to the inlet of the pump is less than the set point value, then the control algorithm will increase the screw speed of the extruder. Conversely, if the inlet pressure is too high the control system will decrease the screw speed.
