1) to sort the array firstly create a min-heap with first $k+1$ elements and a separate array as resultant array. 2) because elements are at most k distance apart from original position so, it is guaranteed that the smallest element will be in this $K+1$ elements.

Algorithms: Design and Analysis, Part 2 | edX

In computer science, the analysis of algorithms is the process of finding the computational complexity of algorithms – the amount of time, storage, or other resources needed to execute them. Usually, this involves determining a function that relates the length of an algorithm's input to the number of steps it takes (its time complexity) or the number of storage locations it uses (its space complexity).

An algorithm is a well-defined finite set of rules that specifies a sequential series of elementary operations to be applied to some data called the input, producing after a finite amount of time some data called the output. Algorithms (along with data structures) are the fundamental “building blocks” from which programs are constructed.
