the IT earthing system is to allow the installation to continue operating in complete safety, without endangering people or equipment, the degree of urgency is very much a relative judgement. In TN and TT earthing systems, the only solution is to clear the fault before resetting the circuit.

The earthing system plays a very important role in a network. On occurrence of an insulation fault or a phase being accidentally earthed, the values taken by the fault currents, touch voltages and overvoltages are closely related to the type of neutral earthing connection. A solidly earthed neutral helps to limit overvoltages.

The international standard IEC60364, part 4, and Reference 10 uses a set of diagrams to explain the five basic methods of earthing and providing the neutral of an electrical installation where it is required. The five methods are abbreviated TNC, TNS, TNCS, TT and IT. The first letter denotes the source of power from a star-connected winding.
