Epipolar Geometry and Stereo Vision - Virginia Tech

Epipolar geometry is the geometry of stereo vision. When two cameras view a 3D scene from two distinct positions, there are a number of geometric relations between the 3D points and their projections onto the 2D images that lead to constraints between the image points.

Epipolar geometry - Wikipedia

The application of projective geometry techniques in computer vision is most notable in the Stereo Visionproblem which is very closely related to Structure-from-Motion. Unlike general motion, stereo vision assumes that there are only two shots of the

Epipolar Geometry

8.1 Epipolar geometry The epipolar geometry between two views is essentially the geometry of the inter-section of the image planes with the pencil of planes having the baseline as axis (the baseline is the line joining the camera centres). This geometry is usually motivated by considering the search for corresponding points in stereo matching, and we will

Epipolar Geometry and the Fundamental Matrix

The fundamental matrix expresses the epipolar geometry in stereo images. The Epipolar geometry in images taken with perspective cameras appears as straight lines. However, in satellite images, the image is formed during the sensor movement along its orbit. Therefore, there are multiple projection centers for one image scene and the epipolar line is formed as an epipolar curve.

Epipolar geometry in stereo, motion, and object ...

Stereoscopy (also called stereoscopies, or stereo imaging) is a technique for creating or enhancing the illusion of depth in an image by means of stereopsis for binocular vision. The word stereoscopy derives from Greek στερεός (stereos), meaning 'firm, solid', and σκοπέω (skopeō), meaning 'to look, to see'. Any stereoscopic image is called a stereogram.
