Fortran 77 has only one type for integer variables. Integers are usually stored as 32 bits (4 bytes) variables. Therefore, all integer variables should take on values in the range [-m,m] where m is approximately $2 \cdot 10^9$. Fortran 77 has two different types for floating point variables, called real and double precision.

FORTTRAN 77 also allows computer memory to be used as if it was an external file. This internal file exists only whilst the program is executing and behaves like a formatted sequential file. An internal file is a CHARACTER object such as a constant, variable, substring, array or array element, and is most often used for converting between CHARACTER and other data types.

One such loop is called a do-while loop which iterates zero or more times. FORTRAN 77 does not have a formal do-while loop structure but it is easy to construct one using IF and GO TO statements. label IF (logical-expression) THEN statement block GO TO label END IF

Fortran 77 has two different types for floating point variables, called realand double precision. While realis often adequate, some numerical calculations need very high precision and double precisionshould be used. Usually a real is a 4 byte variable and the double precision is 8 bytes, but this is machine dependent. Some

The I/O system is just being more lenient than described in the FORTRAN Standard. In general, when doing a formatted read of noncharacter variables, commas override field lengths. More precisely, for the I w , F w.d , E w.d [Ee], and G w.d input fields, the field ends when w characters have been scanned, or a comma has been scanned, whichever ...

Format Specifiers (FORTRAN 77 Language Reference)

An important practical extension to FORTRAN 77 was the release of MIL-STD-1753 in 1978. This specification, developed by the U.S. Department of Defense, standardized a number of features implemented by most FORTRAN 77 compilers but not included in the ANSI FORTRAN 77 standard. These features would eventually be incorporated into the Fortran 90 standard.

FORTTRAN 77 Because of its timing, FORTRAN 77 is the version most people think of when they think of the language. It added a number of important functions. For example, although FORTRAN IV had IF statements (including three-way IF statements), it wasn't until FORTRAN 77 that ELSE and ELSE IF functions were allowed.

The END DOstatement is not a part of the official FORTRAN 77 standard, but it is a part of the Fortran 90/95 standards. Most FORTRAN 77 compilers do support the END DO anyway. In older FORTRAN 77 codes DO loops were coded as in the following code fragment: DO10 I = I_START, I_END, I_INC A(I) = 10.0 * A(I) 10 CONTINUE
