Handbook Of Optical Constants Of

The first part of the Handbook of Optical Constants of Solids II (HOC II) consists of short topics dealing with the determination of optical constants. The chapter also describes critiques that are the critique's own judgment of the best values of refractive index n and extinction coefficient k over the widest spectral range.

While bits and pieces of the index of refraction n and extinction coefficient k for a given material can be found in several handbooks, the Handbook of Optical Constants of Solids gives for the first time a single set of n and k values over the broadest spectral range (ideally from x-ray to mm-wave region). The critiquers have chosen the numbers for you, based on their own broad experience in the study of optical properties.

The Electronic Handbook of Optical Constants of Solids takes the highly praised five-volume set, Handbook of Optical Constants of Solids, to a new level of "information mining" with seamless integration of dynamic data tables, 2D and 3D displays, property calculations, and technical information. The program is designed for amterial scientists, spectroscopists, and optical device designers working with dielectric materials, including metals, semi-conductors, and insulators.

A complete set of the optical constants are presented in tabular and graphical forms over the entire photon-energy range. They are: the complex dielectric constant $\epsilon(E)=\epsilon_1(E)+i\epsilon_2(E)$, the complex refractive index $n^*(E)=n(E)+ik(E)$, the absorption coefficient $\alpha(E)$ and the normal-incidence reflectivity $R(E)$.
