Students will enjoy using M and M's to simulate radioactive decay in this activity from Science NetLinks. This lab demonstrates that the rates of decay of unstable nuclei can be measured, that the exact time that a certain nucleus will decay cannot be predicted, and that it takes a very large number of nuclei to find the rate of decay.

Radioactive Decay: A sweet simulation of half-life Introduction: Testing of radioactive minerals in rocks best determines the absolute age of the rock. In radiometric dating, different isotopes of elements are used depending on the predicted age of the igneous rocks. Potassium/Argon dating is good for rocks 100,000 years old since

Predict what happens to an element when it undergoes alpha decay. Explain the concept of half life, including the random nature of it. Begin to gain an understanding of the forces that work to hold an atomic nucleus together (strong nuclear force) and the forces that work to break it apart (Coulomb, i.e. electric charge, force).

## **RADIOACTIVE DECAY A SWEET SIMULATION OF HALF LIFE ANSWER ...**

This decay is random, and it depends on the nature of the element: this is radioactivity. The half-life of a given isotope is the amount of time it takes for half of the atoms in a sample to decay. This simulation allows you to address, using three different isotopes, notions like radioactive decay, carbon dating, half life constant.

### **Radioactive decay - interactive simulations - eduMedia**

Radioactive Decay: A Sweet Simulation of Half-Life Introduction  
Radioactive decay rates are measured in half-lives. A half-life is the time required for one half of a radioisotope's nuclei to decay into its products. For example, the half-life of the radioisotope strontium-90 is 29 years.
