Reinforced Concrete Design for Circular Sections to Eurocode 2. As mentioned in the previous post, the Reinforced Concrete Design Functions spreadsheet includes a function for ULS analysis of circular sections, using either a rectangular or a parabolic-linear stress block. A new CircuPF function has now been added, for codes that follow a "partial factor" approach to the analysis, as in Eurocode 2.

It explains the background to the Eurocode rules and goes beyond the core topics to cover the design of foundations, retaining walls, water retaining structures. Reinforced Concrete Design to Eurocodes includes more than sixty worked out design examples and over six hundred diagrams, plans and charts. The chapters are fully revised to the Eurocodes and the most commonly encountered design problems in structural concrete are covered.

Like many current national codes in Europe, Eurocode 2 (EC 2) for concrete structures draws heavily on the CEB Model Code. And yet the presentation and terminology, conditioned by the agreed format for Eurocodes, might obscure the similarities to many national codes. Also EC 2 in common with other Eurocodes, tends to be general

Ribbed slabs are widely used in many countries. This is attributed to the rapid shattering, ease of construction, and the reduction in the time of erection. This type of slabs or flooring system consists of series of small closed spaced reinforced concrete T-beams. These floors are suitable for building with light live loads.

Under certain conditions, Eurocode 2 permits the use of strut and tie method for the analysis and design of corbels. According to clause 6.5.1 of EN 1992-1-1:2004, strut-and-tie method can be used where non-linear stress distribution exists (for example at supports, near concentrated loads or plain stress). Strut-and-tie models utilize the lower-bound theorem of plasticity which can be ...
