Reliable information on partition coefficients plays a key role in drug development, as solubility decisively affects bioavailability. In a physicochemical context, the partition coefficient of a solute between two different solvents can be described as a function of solvation free energies. Hence, substantial scientific efforts have been made toward accurate predictions of solvation free ...

The linear solvation energy relationships suggested by Kamlet and Taft was used to examine the effect of solvent descriptors on the behaviour of rutaecarpine solubility. The Hildebrand solubility parameter and dipolarity-polarizability were predominant contributors to solvent effect for the four mixtures studied.

Crucially, solubility applies to all areas of chemistry, geochemistry, inorganic, physical, organic and biochemistry. In all cases it will depend on the physical conditions (temperature, pressure and concentration) and the

enthalpy and entropy directly relating to the solvents and solutes concerned.

The Hildebrand solubility parameters (HSP) and solvation free energy were evaluated to determine the solubility of corresponding model compounds. The main objective of this work is to re-evaluate by MD simulation the boundary between asphaltenes and maltenes proposed by Rodgers, and to examine the applicability of this boundary to the crude oil components.

Intermolecular interaction plays a crucial role in electron solvation in the condensed phase. Here, we present a femtosecond time-resolved and angle-resolved 2-photon photoemission (2PPE) study on the dynamics of electron solvation in a 2-dimensional ammonia film on a metal substrate. While the weak ...

Solvation is, in concept, distinct from solubility. Solvation or dissolution is a kinetic process and is quantified by its rate. Solubility quantifies the dynamic equilibrium state achieved when the rate of dissolution equals the rate of precipitation. The consideration of the units makes the distinction clearer.
